C++ programming language

1.1. Input/Output disable sync

```
ios_base::sync_with_stdio(false);
cin.tie(NULL); cout.tie(NULL);
```

1.2. Optimization pragmas

```
// change to 03 to disable fast-math for geometry problems
#pragma GCC optimize("Ofast,unroll-loops")
#pragma GCC target("avx2,bmi,bmi2,lzcnt,popcnt,tune=native")
```

1.3. Printing structs

```
ostream& operator<<(ostream& os, const pair<int, int>& p) {
   return os << "(" << p.first << ", " << p.second << ")";
}</pre>
```

1.4. Lambda func for sorting

```
using ii = pair<int,int>;

      exp >>= 1;
  }
  return result;
}
```

2.2. Extended euclidean

2.3. Modular inversion & division

gcd_ext defined in Section 2.2.

```
 \exists x(a \cdot x \equiv 1 (\bmod m)) \Leftrightarrow \gcd(a,m) = 1  int mod_inv(int b, int m) {    int x, y;    int g = gcd_ext(b, m, &x, &y);    if (g != 1) return -1;    return (x%m + m) % m; } int m_divide(ll a, ll b, ll m) {    int inv = mod_inv(b, m);    assert(inv != -1);    return (inv * (a % m)) % m; }
```

2.4. Linear Diophantine equation

gcd ext defined in Section 2.2.

}

```

Geometry

3.1. Dot product

$$a \cdot b = |a| |b| \cos(\theta)$$

$$a \cdot b = a_x b_x + a_y b_y$$

$$\theta = \arccos\left(\frac{a_x b_x + a_y b_y}{|a| |b|}\right)$$

Projection of a onto b:

$$\frac{a\cdot b}{|b|}$$

3.2. Cross product

$$a \times b = |a| |b| \sin(\theta)$$
$$a \times b = a_x b_y - a_y b_x$$

 θ is positive if a is clockwise from b

3.3. Line-point distance

Line given by ax + by + c = 0 and point (x_0, y_0) .

$$distance = \frac{|ax_0 + by_0 + c|}{\sqrt{a^2 + b^2}}$$

The coordinates of this point are:

$$x = \frac{b(bx_0 - ay_0) - ac}{a^2 + b^2}$$

$$y = \frac{a(-bx_0 + ay_0) - bc}{a^2 + b^2}$$

3.4. Shoelace formula

$$2A = \sum_{i=1}^{n} \begin{vmatrix} x_i & y_i \\ x_{i+1} & y_{i+1} \end{vmatrix}$$

3.5. Segment to line

$$\begin{split} \left(\left(P_x,P_y\right),\left(Q_x,Q_y\right)\right) \to Ax + By + C &= 0 \\ A &= P_y - Q_y \\ B &= Q_x - P_x \\ C &= -AP_x - BP_y \end{split}$$

Rationing the obtained line equation:

- 1. divide A,B,C by their GCD
- 2. if A < 0 or $A = 0 \land B < 0$ then multiply all by -1

3.6. Three point orientation

3.7. Line-line intersection

From system of linear equations derived Cramer's rule:

$$x = -\frac{c_1b_2 - c_2b_1}{a_1b_2 - a_2b_1}$$
$$y = -\frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1}$$

If the denominator equals zero, the lines are parallel or coincident.

3.8. Check if two segments intersect

```
bool on segment(Point p, Point q, Point r)
   if (q.x \le max(p.x, r.x)) \& q.x \ge min(p.x, r.x) \& \&
       q.y \le \max(p.y, r.y) \&\& q.y >= \min(p.y, r.y))
       return true:
    return false;
bool do intersect(Point p1, Point q1, Point p2, Point q2)
   // Find the four orientations needed for general and
   // special cases
   int o1 = orientation(p1, q1, p2);
   int o2 = orientation(p1, q1, q2);
   int o3 = orientation(p2, q2, p1);
   int o4 = orientation(p2, q2, q1);
   if (o1 != o2 && o3 != o4)
        return true;
   if (o1 == 0 && on_segment(p1, p2, q1)) return true;
   if (o2 == 0 && on segment(p1, q2, q1)) return true;
   if (o3 == 0 && on segment(p2, p1, q2)) return true;
   if (04 == 0 \&\& on segment(p2, q1, q2)) return true:
```

3.9. Heron's formula

Let a, b, c - sides of a triangle. Then the area A is:

$$A = \frac{1}{4}\sqrt{(a+b+c)(-a+b+c)(a-b+c)(a+b-c)} = \frac{1}{4}\sqrt{4a^2b^2 - (a^2+b^2-c^2)^2}$$

Numerically stable version:

$$a \geq b \geq c, A = \frac{1}{4} \sqrt{(a + (b + c))(c - (a - b))(c + (a - b))(a + (b - c))}$$

3.10. Graham's scan

```
struct pt {double x, y;};
int orientation(pt a, pt b, pt c) {
    double v = a.x*(b.y-c.y)+b.x*(c.y-a.y)+c.x*(a.y-b.y);

    if (v > 0) return +1: // counter-clockwise
    return 0;
}

        return make pair(a.y, a.x) < make pair(b.y, b.x);</pre>
    sort(a.begin(), a.end(), [&p0](const pt& a, const pt& b) {
        int o = orientation(p0, a, b);
        if (o == 0)
            return (p0.x-a.x)*(p0.x-a.x) + (p0.v-a.v)*(p0.v-a.v)
                < (p0.x-b.x)*(p0.x-b.x) + (p0.y-b.y)*(p0.y-b.y);
        return o < 0:
    });
    if (include collinear) {
        int i = (int)a.size()-1;
        while (i \ge 0 \&\& collinear(p0, a[i], a,back())) i--:
        reverse(a.begin()+i+1, a.end());

            st.pop_back();
        st.push_back(a[i]);
    }
    a = st;

3.11. Circumradius

Let $a,\,b,\,c$ - sides of a triangle. A - area of the triangle. Then the circumradius is:

$$R = \frac{abc}{4A}$$

    }
    return res;
}
```

5.6. Flow with demands

Finding an arbitrary flow

- Assume a network with [L;R] on edges (some may have L=0), let's call it old network.
- Create a New Source and New Sink (this will be the src and snk for Dinic).
- Modelling network:
- 1. Every edge from the old network will have cost R-L
- 2. Add an edge from New Source to every vertex v with cost:
 - S(L) for every (u, v). (sum all L that LEAVES v)
- 3. Add an edge from every vertex v to New Sink with cost:
 - S(L) for every (v, w). (sum all L that ARRIVES v)
- 4. Add an edge from Old Source to Old Sink with cost INF (circulation problem)
- The Network will be valid if and only if the flow saturates the network (max flow == S(L))

Finding Min Flow

- To find min flow that satisfies just do a binary search in the (Old Sink
 Old Source) edge
- The cost of this edge represents all the flow from old network
- Min flow = S(L) that arrives in Old Sink + flow that leaves (Old Sink -> Old Source)
